Listening at scale.

> **Sikia is an AI-powered technology that helps research teams gather and analyse in-depth feedback from more people, more efficiently, in their native languages.**

Trained to understand local nuances, Sikia captures perspectives that traditional research methods often miss, uncovering insights previously lost in translation.

Works offline

A reliable tool for hard-to-reach places. It records conversations and probes in real time, even when offline.

Runs the show

From AI form builder to running quality checks and insight discovery on full interview transcripts.

Insights in minutes

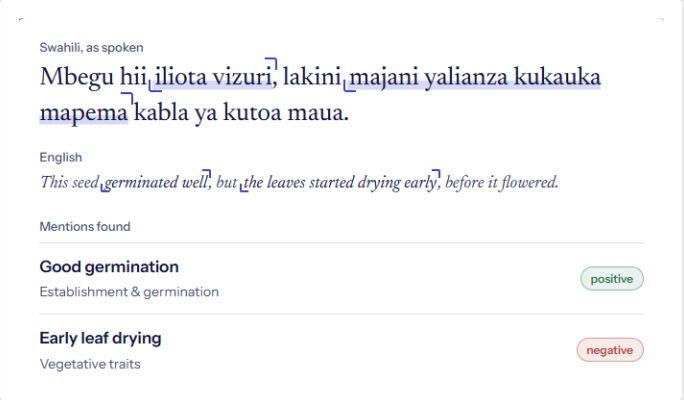

Turn uploaded fieldwork into structured results and reports in minutes instead of days.

Who is Sikia for?

No depth or scale trade-off

Running interviews is time-consuming and costly to scale. When conversations take place in under-resourced languages, translation and manual analysis can introduce bias and miss important local nuances.

Sikia is built for anyone looking to collect evidence and insights from people who only speak local languages and often live in places with limited internet connectivity. Deployed on a smartphone, it listens to conversations, probes in real time, and reads full transcripts, enabling new discoveries and analytics.

One spoken answer in Swahili: transcribed, translated, and coded into named categories.

How it works

1 · Design

Use the AI form builder to define what each interview should cover. Sikia supports ODK .xls forms and ClimMob.

2 · Converse

An interviewer holds an open conversation with the respondent, while Sikia is listening on an ordinary smartphone, in the respondent's own language.

3 · Probe

Sikia tracks what is still missing and suggests the next question in real time, in areas with low or no connectivity.

4 · Deliver

Once the phone syncs, speech becomes transcripts. LLMs trained on local languages convert them into rich themes and insight reports.

An interview recorded on a smartphone, in the respondent's own language. The probing continues whether or not there is a signal.

What makes Sikia different

- Dynamic probing runs on the device. Follow-up questions adapt to the answer given, with no internet connectivity.
- Speech models built for low-resource African languages, not repurposed from global English.
- Runs on ordinary Android phones and tablets, so fieldwork scales without hardware procurement.

Alliance Bioversity & CIAT

sikia.

What you get back

What you get	Format	Efficiency
Survey data Every answer, with the audio questions carrying their transcript and English translation as ordinary columns	Excel, CSV, JSON, SPSS, Stata — variable labels intact	On click
Interview transcripts The full conversation and the answers it produced, with an English column beside the original	Word-style documents, CSV, Excel	On click
Analysis results Every theme, sentiment and coded answer mentioned	CSV, Excel	On click
The written report Executive summary, findings, charts, quoted verbatims, limitations, methodology annex	PDF	Minutes
Audio recordings Play or save any individual recording from the response it belongs to	MP3 or original file	On click

Languages

Live **Swahili · Amharic · Hausa**
In production, supporting the studies running today

Ready-made **High-resource languages**
English, Spanish, French, Arabic and any other high-resource languages are supported "off-the-shelf"

Refining **Oromo**
Supported, with further refinement underway

2027 **Chichewa · Yoruba · Shona**
Committed before the end of 2027

Where is it running

We have used Sikia for product concept testing in Ethiopia and Tanzania, and to evaluate rice research in Colombia. In Q1 2027, we will use Sikia for consumer surveys in Hausa in Nigeria.

Nothing in the platform is specific to one sector. Any study that needs people to explain themselves in their own words in a place with poor connectivity is a fit.

Product & concept testing · Market intelligence · Policy & evaluation · Public health · Education · Conservation

Access, data and ethical considerations

- Everyone signs in; everything goes through the authenticated service.
- Encrypted in transit and at rest. Recordings and photos are accessible only through expiring links, and personal information is scrambled before use.
- A study carries its consent text in each language, whether the respondent taps it or an interviewer reads it aloud and confirms.
